

How to make cool websites with Manus

Find images for reference

Examples (I found these on Godly):

1. Create images to use:

1. Go on Pinterest to find aesthetic photos
2. Adjust them to your liking using Canva or Photoshop

Examples: (I made the logo using Canva; I took all the images from Pinterest and adjusted them to make them look good on a website using Canva)

3. Put all images you've gathered into Manus

4. Create 1st prompt using this template:

Act as a senior front-end engineer and creative director. Prioritize visual impact, aesthetic execution, and fidelity to these instructions.

Reference [Attach screenshots] [URL for context only] — Treat these images as the aesthetic source of truth. Extract the visual style, tone, and design language — but do not replicate its content or layout. The concept below defines what to actually build.

Concept This is an original build.

Who: [target audience].

What: [what the site does or offers].

Feel: [emotional tone].

Visual anchor: [one defining visual detail].

Every design decision should serve this concept.

Design System Extract colors, fonts & spacing from the reference. If not in the system, don't use it.

Layout & Structure Build the following sections in this order: [list your sections — e.g. Hero, About, Features, CTA, Footer]. Match the spacing and alignment aesthetic from the reference.

UI Components Incorporate the following pre-built components exactly as provided. Do not restyle, rebuild, or modify them under any circumstances. Slot them into the layout where specified.

Typography Use fonts that match the aesthetic tone of the reference. If not found, find the closest alternative.

Visual Elements (SVG) Use SVGs for all icons and shapes. Match the visual tone of the reference.

Animation (GSAP / Framer) Animate only with purpose. Use GSAP. No random motion. No layout shifts.

Responsiveness Adapt for all devices — don't redesign. Preserve the original intent.

Code Quality Write production-ready code. Clean structure. No placeholders or TODOs.

Forbidden Actions Do NOT deviate from the reference aesthetic. Do NOT invent sections not listed in the layout. Do NOT use placeholder text. Do NOT deliver incomplete code.

Final Review Self-review against the concept. Does the design match the aesthetic reference? Is the concept accurately represented? Is the code production-ready? Deliver only when the answer to all of these is yes.

5. Make adjustments

List out all your changes at once

Always include “Don’t touch anything other than what I listed

Keep everything else exactly as is” at the end

(don’t worry if it looks dookey after the first one cause it took me over 10 adjustment prompts to get the look I wanted!)

Example:

- *Remove the chrome text “COLDSTART RUNNING CLUB” and the logo on top of it that I gave you in the hero section. Replace it with it alongside removing the background image with the new one I provided (the two people in hoodies towards the right side with the COLDSTART logo on top of them)*
- *Create a nav bar with rounded edges that have a home, story and join selections that take you to the respective sections on the website.*
- *Include the logo I gave you in the previous message in the nav bar on the left. Integrate it seamlessly*
- *Remove the “SCROLL” text in the hero and replace it with a minimal thin white arrow pointing down indicating to scroll more*
- *Replace the second image of the people stretching in a circle with the image of the 4 guys running on a track i provided. Integrate it seamlessly by having that image on the right of the text in the story section*
- *Shorten the text in the story section to make it more succinct*
- *Incorporate more of the scrolling faint white outline text in the back to add visual interest*

Don’t touch anything other than what I listed

Keep everything else exactly as is

6. DONE

Boom, you got a fresh-looking website that is on the same pedigree as this:

<https://coldstartrc-7i6ivppc.manus.space/>
